These topics build on foundational concepts introduced in earlier terms, emphasizing both theoretical understanding and practical applications. The curriculum aims to develop students' ability to analyze electrical circuits, understand electromagnetic principles, and apply physics concepts to real-world problems.

Key Topics Covered in Term 3

The core topics include:

- Electric Circuits and Ohm's Law
- Series and Parallel Circuits
- Electrical Power and Energy
- Magnetic Fields and Electromagnetism
- Electromagnetic Induction
- Applications of Electricity and Magnetism

Each section is essential for a well-rounded understanding of physics and forms the basis for more advanced studies in the subject.

Electric Circuits and Ohm's Law

Understanding Electric Circuits

Electric circuits are closed paths through which electric current flows. Basic components include:

- Power source (battery or power supply)
- Conductors (wires)
- Loads (resistors, bulbs, appliances)
- Switches

Ohm's Law

Ohm's Law is fundamental in understanding how voltage, current, and resistance relate in a circuit:

$$V = IR$$

Where:

- V = Voltage (Volts, V)
- I = Current (Amperes, A)
- R = Resistance (Ohms, ?)

This law states that the voltage across a resistor is directly proportional to the current flowing through it, with resistance as the constant of proportionality.

Practical Applications of Ohm's Law

- Calculating unknown values in circuits
- Designing electrical devices
- Troubleshooting electrical faults

Series and Parallel Circuits

Series Circuits

In a series circuit:

- Components are connected end-to-end in a single loop.

- The current is the same through all components.
- The total resistance is the sum of individual resistances:

$$R_{\text{total}} = R_1 + R_2 + R_3 + \dots$$

- The total voltage divides among components.

Parallel Circuits

In a parallel circuit:

- Components are connected across the same two points.
- The voltage across each branch is the same.
- The total current is the sum of currents through each branch:

$$I_{\text{total}} = I_1 + I_2 + I_3 + \dots$$

- The total resistance is given by:

$$1/R_{\text{total}} = 1/R_1 + 1/R_2 + 1/R_3 + \dots$$

Comparison and Uses

| Feature | Series Circuit | Parallel Circuit |

|-----|-----|-----|

| Current | Same everywhere | Divides among branches |

| Voltage | Divides among components | Same across each branch |

| Resistance | Increases with more components | Decreases with more branches |

| Usage | Decorative lights, simple circuits | Home wiring, electronic devices |

Electrical Power and Energy

Electrical Power

Power consumed in an electrical circuit is calculated as:

$$P = VI$$

or using Ohm's Law:

$$P = I^2 R$$

Where:

- P = Power (Watts, W)

Electrical Energy Consumption

Energy used over time is:

$$E = P \times t$$

- E = Energy (Joules, J)
- t = time (seconds)

In household contexts, energy consumption is measured in kilowatt-hours (kWh):

$$1 \text{ kWh} = 1000 \text{ W} \times 3600 \text{ seconds}$$

Efficiency and Power Loss

Understanding power dissipation and efficiency helps in designing energy-efficient systems.

Magnetic Fields and Electromagnetism

Magnetic Fields

A magnetic field is the region around a magnet where magnetic forces are exerted. Key points include:

- Magnetic field lines emerge from the north pole and enter the south pole.
- The strength of the magnetic field is indicated by the density of lines.
- Magnetic fields are generated by moving charges (electric currents).

Electromagnetism

This is the relationship between electricity and magnetism. When an electric current flows through a wire, it produces a magnetic field.

Applications

- Electric motors
- Transformers
- Electromagnetic relays

Electromagnetic Induction

Principle of Electromagnetic Induction

When a conductor moves within a magnetic field or the magnetic flux through a coil changes, an electromotive force (EMF) or voltage is induced.

Faraday's Law of Induction

The induced EMF is proportional to the rate of change of magnetic flux:

$$\text{EMF} = -\frac{d\phi}{dt}$$

Where:

- ϕ = magnetic flux (Weber, Wb)
