Common Chemistry Lab Viva Questions and Sample Answers

Below are categorized questions frequently asked during chemistry lab vivas, along with detailed answers to help students prepare confidently.

1. Safety Protocols and Precautions

- **Q: What are the safety precautions to be taken while handling acids and bases?**

- **A:** When handling acids and bases, always wear appropriate personal protective equipment (PPE) such as lab coats, gloves, and goggles. Handle acids slowly to prevent splashes, use a fume hood if fumes are released, and add acid to water (not water to acid) to prevent violent reactions. Properly label containers and dispose of chemicals as per safety guidelines.

- **A:** First, alert others and ensure safety by evacuating the area if necessary. Use appropriate spill kits and neutralizing agents for specific chemicals. Wear PPE and clean the spill carefully, following standard procedures. Dispose of waste safely and report the incident to the supervisor.

2. Laboratory Techniques and Equipment

- **Q: How do you calibrate a burette before titration?**

- **A:** To calibrate a burette, rinse it with distilled water and then with the titrant to be used. Fill the burette slightly above the 0 mL mark, then open the tap to allow the liquid to flow out until the meniscus is exactly at the 0 mL mark when viewed at eye level. Record the volume and ensure there are no air bubbles in the nozzle.

- **Q: Describe the method to prepare a standard solution.**

- **A:** Weigh an accurate amount of pure solute and dissolve it in a small volume of solvent. Transfer this solution to a volumetric flask and dilute to the mark with distilled water. Mix thoroughly to obtain a uniform solution. Label the solution properly for future use.

3. Chemical Properties and Reactions

- **Q: What is the principle of titration?**

- **A:** Titration is based on the principle of reacting a solution of unknown concentration with a solution of known concentration (titrant) until the reaction reaches the equivalence point, indicated by a color change (using indicators) or other detection methods. It allows calculation of the unknown concentration using the volume of titrant used.

- **Q: Explain the difference between a strong acid and a weak acid with examples.**

- **A:** A strong acid completely ionizes in water, releasing a high concentration of H^+ ions. Examples include hydrochloric acid (HCl), sulfuric acid (H_2SO_4), and nitric acid (HNO_3). A weak acid partially ionizes in water, resulting in a lower concentration of H^+ ions. Acetic acid (CH_3COOH) and carbonic acid (H_2CO_3) are common examples.

4. Analytical and Quantitative Chemistry

- Q: How is molarity calculated in a solution?

- A: Molarity (M) is calculated by dividing the number of moles of solute by the volume of solution in liters: $M = \text{mol of solute} / \text{liters of solution}$.

- Q: Describe the process of gravimetric analysis.

- A: Gravimetric analysis involves isolating a precipitate formed during a chemical reaction, filtering, washing, and drying it to a constant weight. The mass of the precipitate is used to determine the amount of analyte present in the original sample.

5. Troubleshooting and Common Issues

- Q: What should you do if the color change in titration is ambiguous?

- A: If the color change is ambiguous, use a suitable indicator with a clear endpoint for the specific titration. Perform multiple titrations to ensure consistency and accuracy. Ensure proper mixing during titration for a sharp endpoint.

- Q: How do you correct for air bubbles in a burette?

The Significance of Chemistry Lab Viva

Before delving into specific questions, it's crucial to understand the importance of the viva in the overall assessment. Unlike written exams that test theoretical knowledge, viva voce or oral examination emphasizes communication skills, clarity of understanding, and practical application of concepts learned in the laboratory.

Key objectives of a chemistry lab viva include:

- Verifying the student's understanding of experimental procedures
- Assessing safety protocols and responsible laboratory conduct
- Testing the ability to analyze and interpret experimental data
- Gauging problem-solving skills and adaptability
- Encouraging scientific communication and confidence

Given these objectives, preparing for common questions becomes vital for success.

Common Categories of Viva Questions in Chemistry Labs

Chemistry lab viva questions can broadly be categorized into several themes:

- Basic Concepts and Principles

- Safety and Precautions
- Experimental Procedures
- Analysis and Interpretation of Results
- Error Analysis and Troubleshooting
- Applications and Real-world Relevance

Let's explore each category in depth, along with sample questions and comprehensive answers.

- Basic Concepts and Principles

Understanding fundamental concepts is fundamental to any scientific discipline. Viva questions in this category often test students' grasp on the core principles underlying their experiments.

Sample Questions and Answers

Q1. What is the purpose of using a burette in titration?

Answer:

A burette is used to accurately measure and deliver precise volumes of a titrant during titration. Its fine graduations allow for precise control of the volume added, which is essential in determining the concentration of an unknown solution through stoichiometric calculations.

Q2. Explain the difference between qualitative and quantitative analysis.

Answer:

Qualitative analysis involves identifying the presence or absence of specific chemical constituents in a sample, focusing on composition. Quantitative analysis, on the other hand, determines the amount or concentration of these constituents, often through measurements like titration, gravimetric analysis, or spectrophotometry.

Q3. What is molarity, and how is it different from molality?

Answer:

Molarity (M) is defined as the number of moles of solute per liter of solution. Molality (m) is the number of moles of solute per kilogram of solvent. Molarity depends on volume, which can vary with temperature, while molality is based on mass and remains constant regardless of temperature changes.

- Safety and Precautions

Safety is paramount in any laboratory setting. Questions in this category assess students' awareness of safety protocols, proper handling of chemicals, and emergency procedures.

Sample Questions and Answers

Q1. What safety precautions should you follow while handling acids?

Answer:

When handling acids, always wear appropriate personal protective equipment (PPE) such as gloves, goggles, and lab coats. Work in a well-ventilated area or fume hood. Add acids slowly to water to prevent splashing or boiling over, and handle with care to avoid spills or contact with skin and eyes. Know the location of safety showers and eyewash stations.

Q2. What is the proper way to dispose of chemical waste?

Answer:

Chemical waste should be disposed of according to institutional safety guidelines and local regulations. Usually, incompatible chemicals should not be mixed. Acidic and basic wastes are neutralized before disposal, and organic solvents are collected separately. Always label waste containers clearly and never pour chemicals down the sink unless permitted.

Q3. Why is it important to wear safety goggles during experiments?

Answer:

Safety goggles protect the eyes from splashes, fumes, and accidental spills of hazardous chemicals, which could cause serious injury or blindness. Eye protection is a fundamental safety measure that should never be overlooked.

- Experimental Procedures

This section covers questions related to the practical steps, techniques, and methodologies used during experiments.

Sample Questions and Answers

Q1. Describe the process of standardizing a sodium hydroxide solution using oxalic acid.

Answer:

To standardize NaOH with oxalic acid, a known concentration of oxalic acid (which is a primary standard) is titrated against the NaOH solution. First, a fixed volume of oxalic acid solution is measured, and a few drops of a suitable indicator (e.g., phenolphthalein) are added. The NaOH solution is then titrated until a color change indicates the endpoint. Using the known molarity of oxalic acid and the volume used, the molarity of NaOH can be calculated via stoichiometry.

Q2. How do you determine the endpoint of a titration?

Answer:

The endpoint is the point at which the reaction between titrant and analyte is complete. It is usually detected by a color change of an indicator. For example, phenolphthalein turns from colorless to pink in basic solutions. The choice of indicator depends on the type of titration and pH range.

Q3. Why is it necessary to rinse the burette with the titrant before starting a titration?

Answer:

Rinsing the burette with the titrant ensures that the concentration inside the burette is uniform and prevents dilution of the titrant. This helps in achieving accurate and precise measurements.

- Analysis and Interpretation of Results

Viva questions often probe the student's ability to interpret data, analyze results critically, and draw valid conclusions.

Sample Questions and Answers

Q1. How do you calculate the molarity of an unknown acid solution from a titration?

Answer:

Using the titration data, apply the titration formula:

$$M_1V_1 = M_2V_2$$

where M_1 and V_1 are molarity and volume of the known titrant, and M_2 and V_2 are molarity and volume of the unknown acid. Rearranging gives:

$$M_2 = \frac{M_1 V_1}{V_2}$$

Plug in the measured values to compute the molarity of the unknown acid.

Q2. If the titration takes more volume than expected, what could be the reasons?

Answer:

Possible reasons include:

- Inaccurate readings or parallax errors
- Impurities in chemicals
- Incorrect endpoint detection
- Loss of titrant during transfer
- Incomplete reaction or side reactions

Q3. How do you determine the purity of a sample based on titration data?

Answer:

By performing a titration to find the amount of pure substance in the sample, compare the calculated amount to the theoretical amount based on the sample's mass. The percentage purity is calculated as:

$$\text{Purity (\%)} = \frac{\text{Actual amount of pure substance}}{\text{Sample weight}} \times 100$$

- Error Analysis and Troubleshooting

Acknowledging and analyzing errors foster a scientific mindset. Typical questions focus on identifying sources of error and rectification.

Sample Questions and Answers

Q1. What are common sources of error in volumetric titrations?

Answer:

Common errors include:

- Using misread burette readings
- Incomplete mixing during titration
- Delayed detection of endpoint
- Contamination or impurities in reagents
- Loss of titrant or analyte during transfer

Q2. How can you minimize experimental errors?

Answer:

To minimize errors:

- Use calibrated and clean apparatus
- Perform multiple titrations for consistency
- Add titrant slowly near the endpoint
- Record readings carefully to avoid parallax errors
- Use appropriate indicators and ensure proper endpoint detection

Q3. If you observe a consistently high titration volume, what troubleshooting steps would you take?

Answer:

Steps include:

- Checking the concentration and freshness of reagents
- Ensuring proper rinsing of apparatus
- Verifying the endpoint indicator and its compatibility
- Confirming no leaks or losses in the setup
- Repeating the titration with fresh samples

- Applications and Real-World Relevance

Connecting laboratory work to real-world applications enhances understanding and motivation.

Sample Questions and Answers

Sample Viva Voce Questions for Chemistry Class 12 with Answers

Below is a categorized list of common viva questions along with detailed answers to help students prepare effectively.

1. Solid State

- What is a crystal lattice?

A crystal lattice is a three-dimensional arrangement of ions, atoms, or molecules in a crystalline solid, repeating periodically in space. It defines the geometric pattern and symmetry of the crystal structure.

- Explain the difference between crystalline and amorphous solids.

Crystalline solids have a well-ordered, repeating arrangement of particles, resulting in sharp melting points and anisotropic properties. Amorphous solids lack long-range order, have irregular structures, and melt over a range of temperatures.

- What are unit cells? Describe different types of unit cells.

A unit cell is the smallest repeating unit in a crystal lattice that reflects the entire structure's symmetry. Types include:

- Primitive (P) ? particles at corners only
- Body-centered (BCC) ? particles at corners and center
- Face-centered (FCC) ? particles at corners and face centers

2. Solutions

- Define molarity and molality.

Molarity (M) is moles of solute per liter of solution. Molality (m) is moles of solute per kilogram of solvent.

- What is Henry's law?

Henry's law states that at constant temperature, the amount of gas dissolved in a liquid is directly proportional to the partial pressure of the gas above the liquid.

- Explain the concept of boiling point elevation and freezing point depression.

Both are colligative properties. Boiling point elevation occurs when dissolved particles raise the boiling point; freezing point depression lowers the freezing point. These effects depend on the number of solute particles, not their identity.

3. Electrochemistry

- Define standard electrode potential.

It is the electrode potential of a half-cell measured under standard conditions (1 M concentration, 1 atm pressure, 25°C) against the standard hydrogen electrode.

- What is the significance of Gibbs free energy in electrochemistry?

The Gibbs free energy change (ΔG) determines the spontaneity of an electrochemical reaction. A negative ΔG indicates a spontaneous reaction.

- Explain Faraday's laws of electrolysis.

First law states that the amount of substance deposited or liberated at an electrode is proportional to the quantity of electricity passed. The second law states that the amounts deposited by equal

currents are proportional to their equivalent weights.

4. Chemical Kinetics

- What is the order of a reaction?

The order of a reaction indicates how the rate depends on the concentration of reactants. It is determined experimentally and can be zero, first, second, etc.

- State and explain the collision theory of reactions.

The collision theory states that chemical reactions occur when reactant particles collide with sufficient energy and proper orientation.

- What is activation energy?

Activation energy is the minimum energy required for reactant particles to undergo a successful collision leading to a reaction.

5. Surface Chemistry

- Define adsorption and desorption.

Adsorption is the process where molecules adhere to a surface, while desorption is the removal of adsorbed molecules from the surface.

- What are catalysts? How do they affect chemical reactions?

Catalysts are substances that increase the rate of a reaction without being consumed. They provide an alternative pathway with lower activation energy.

- Explain the importance of colloids in everyday life.

Colloids are important in products like milk, fog, smoke, and medicines, and have applications in industry, medicine, and environmental protection.
